# Assignment 1 (COMP 7402)

## Task 1: Number Theory Practice Question and Problems

Q1: Given  $a = -12$  and  $n = 7$ . Derive an equation that relates both integers using the division algorithm.

TASK 1: Number Theory Practice questions and problems				
1) Given $a = -12$ and $n = 7$ . Derive an equation that relates both integers using the division algorithm.				
	$a = q \times n + r$ , $q = \frac{a}{n}$ , $0 \leq r < n$			
	$-12 = \left\lfloor \frac{-12}{7} \right\rfloor \times 7 + r$		$-12 = (-2 \times 7) + 2$	
	$-12 = -2 \times 7 + r$			
	$-12 = -14 + r$			
	<del><math>-12 = -14 + r</math></del>			
	$2 = r$			
2) Use the Euclidean algorithm to determine $\text{GCD}(24140, 16762)$ .				
Quotient	A	B	Remainder	
1	24140	16762	7,378	
2	16762	7,378	0,000	

Q2: Use the Euclidean algorithm to determine  $\text{GCD}(24140, 16762)$ .

$$\begin{aligned}
 -12 &= \left\lfloor \frac{-12}{7} \right\rfloor \times 7 + r \\
 -12 &= -2 \times 7 + r \\
 -12 &= -14 + r \\
 -12 &= -14 + r \\
 2 &= r
 \end{aligned}$$

2) Use the Euclidean algorithm to determine  $\text{GCD}(24140, 16762)$ .

Quotient	A	B	Remainder
1	24140	16762	7378
2	16762	7378	2006
3	7378	2006	1360
1	2006	1360	646
2	1360	646	68
9	646	68	34
2	68	34	0
0	34	0	x

3) Find two integers  $x$  that  $x'$  that satisfies the equation  $5x \equiv 4 \pmod{3}$

$$5x \equiv 4 \pmod{3}$$

$$8x - 3x \equiv 4 \pmod{3}$$

$$\text{Note: } -3x \pmod{3} \equiv 0$$

Q3: Find two integers  $x$  and  $x'$  that satisfies the equation  $5x \equiv 4 \pmod{3}$ .

Quotient	A	B	Remainder
1	24140	16762	7378
2	16762	7378	2006
3	7378	2006	1360
1	2006	1360	646
2	1360	646	68
9	646	68	34
2	68	34	0
0	34	0	X

2) Use the Euclidean algorithm to determine  $\text{GCD}(24140, 16762)$ .

3) Find two integers  $x$  and  $x'$  that satisfies the equation  $5x \equiv 4 \pmod{3}$   
 $5x \equiv 4 \pmod{3}$  Note:  $-3x \pmod{3} \equiv 0$   
 $8x \equiv 4 \pmod{3}$  Note:  $\text{GCF}(8, 4) \equiv 4$   
 $2x \equiv 1 \pmod{3}$  Note:  $a \equiv b \pmod{n}$  if  $n | (a-b)$   
 $\frac{3}{2x-1} = 1$   
 $2x-1 = 1 \rightarrow 4 = 2x \rightarrow 2 = x$

$x \pmod{6}$

Finding  $x'$

$2(x) \equiv 1 \pmod{3}$  Note: plug 2 for  $x$

$2(2) \equiv 1 \pmod{3}$  Note:  $a^{p-1} \equiv 1 \pmod{p}$

$4^{3-1} \equiv 1 \pmod{3}$

$16 \equiv 1 \pmod{3}$  What multiple of 2 give 16  $(8)$  so...

$$x = 2 \text{ and } x' = 8$$

4) Use the extend Euclidean algorithm to find the modular multiplicative inverse of 1234 mod 4321.

i	r <sub>i</sub>	q <sub>i</sub>	x <sub>i</sub>	y <sub>i</sub>
-1	4321	x	1	0
0	1234	x	0	1
1	619	3	1	-3
2	615	1	-1	4

$x_1 = 1 - 3(0) \quad y_1 = 0 - 3(-1)$   
 $x_2 = (0) - 1(1) \quad y_2 = (-1 - 1/2)$

Q4: Use the extend Euclidean algorithm to find the modular multiplicative inverse of 1234 mod 4321.

$$4^{3-2} \equiv 1 \pmod{3}$$

$$16 \equiv 1 \pmod{3}$$

What multiple of 2 give 16 mod 8? So...  
 $x = 2$  and  $x' = 8$

- 4) Use the extend Euclidean algorithm to find the modular multiplicative inverse of 1234 mod 4321.

i	r <sub>i</sub>	q <sub>i</sub>	x <sub>i</sub>	y <sub>i</sub>
-1	4321	x	1	0
0	1234		0	1
1	619	3	1	$x_1 = 1 - 3(0)$ $y_1 = 0 - 3(-1)$
2	615	1	-1	$x_2 = (0) - 1(1)$ $y_2 = 1 - 1(-3)$
3	4	1	2	$x_3 = (1) - 1(-1)$ $y_3 = -3 - 1(4)$
4	3	153	-307	$x_4 = (-1) - 153(2)$ $y_4 = 4 - 153(-7)$
5	1	1	309	$x_5 = (2) - 1(-307)$ $y_5 = -7 - 1(1075)$
6	0	3	x	

The modular multiplicative inverse of 1234 mod 4321 is 3239 or 1082

- 5) Using Fermat's theorem find  $3^{201} \pmod{11}$ ?

$$\text{ans} = 3^{201} \pmod{11}$$

$$3^{11-1} \equiv 1 \pmod{11} \quad (\text{Fermat's theorem})$$

$$3^{10} \equiv 1 \pmod{11}$$

## Q5: Using Fermat's theorem find $3201 \bmod 11$ .

- 4) Use the extend Euclidean algorithm to find the modular multiplicative inverse of  $1234 \bmod 4321$ .

$i$	$x_i$	$y_i$	$x_{i+1}$	$y_{i+1}$
-1	4321	$\times$	1	0
0	1234	$\times$	0	1
1	$619 \div$	3	1	-3
2	$615 \div$	1	-1	4
3	$4 \div$	1	2	-7
4	$3 \div$	153	-307	1075
5	1	1	309	-1082
6	0	3	$\times$	$\times$

The modular multiplicative inverse of  $1234 \bmod 4321$  is  $3239$ .

- 5) Using Fermat's theorem find  $3^{202} \bmod 11$ ?

$$\text{ans} = 3^{202} \bmod 11$$

$$3^{11-1} \equiv 1 \bmod 11 \Rightarrow 1 \quad (\text{Fermat's theorem})$$

$$3^{10} \equiv 1 \bmod 11$$

Another way to write  $3^{202}$  is  $(3^{10})^{20} \times 3$ . And we know  $3^{10} \equiv 1$ .

$$(1)^{20} \times 3 = 3 \text{ so, we can plug 3 for } 3^{202}.$$

$$3 \bmod 11 \equiv 3^{202} \bmod 11 \equiv 3.$$

So ans = 3.

- 6) Use Euler's Theorem to find a number  $a$  between 0 and 9 such that  $a$  congruent to  $7^{1000} \bmod 10$ ?

$$\text{We know } a^{\phi(n)} \equiv 1 \pmod{n}, \text{ euler's theorem.}$$

$$\text{and } \phi(n) = (p-1)(q-1) \text{ where } p \text{ and } q \text{ are prime factors of } n \text{ and } p \neq q.$$

$$a = ? \quad n = 10 \quad (p=5 \quad q=2)$$

$$a^{\phi(10)} \equiv 1 \pmod{10}; \quad \phi(10) = (5-1)(2-1) = 4$$

$$(a)^4 \equiv 1 \pmod{10} \Rightarrow 7^{1000} \equiv 1 \pmod{10}$$

$$7^{1000} \pmod{10}$$

$$(7^4)^{250} \pmod{10} \Rightarrow 2401 \pmod{10} \equiv 1$$

$$(1)^{250} \pmod{10}$$

$$1 \pmod{10}$$

Q6: Use Euler's Theorem to find a number  $a$  between 0 and 9 such that  $a$  is congruent to  $7^{1000} \pmod{10}$ .

$3 \pmod{11} \equiv 3^{201} \pmod{11} \equiv 3$ .  
So ans = 3.

b) Use Euler's Theorem to find a number  $a$  between 0 and 9 such that  $a$  congruent to  $7^{1000} \pmod{10}$ ?  
We know  $a^{\phi(n)} \equiv 1 \pmod{n}$ . Euler's theorem.  
and  $\phi(n) = (p-1)^*(q-1)$  where  $p \& q$  are prime and factors of  $n$  and  $p \neq q$ .  
 $a = ? \quad n = 10 \quad (p = 5 \quad q = 2)$

$$a^{\phi(10)} \equiv 1 \pmod{10}; \quad \phi(10) = (5-1)(2-1) = 4$$

$$(a)^4 \equiv 1 \pmod{10} \equiv 7^{1000} \pmod{10}$$

$$\begin{aligned} 7^{1000} &\pmod{10} \\ (7^4)^{250} &\pmod{10} \rightarrow 2401 \pmod{10} \equiv 1 \\ (1)^{250} &\pmod{10} \\ 1 \pmod{10} \end{aligned}$$

$$(a)^4 \equiv 1 \pmod{10} \equiv (7^4)^{250}$$

$$\boxed{a = 7}; \quad 0 \leq a \leq 9; \quad a^{\phi(n)} \equiv 1 \pmod{10} \equiv 7^{1000} \pmod{10}$$

Q7: The Miller-Rabin test can determine if a number is not prime but cannot determine if a number is prime. How can such an algorithm be used to test for primality?

The Miller-Rabin test is a probabilistic algorithm that can determine if a number is composite but cannot definitively prove that a number is prime. However, it can still be effectively used to test for primality.

While the test is not deterministic, because its probabilistic it is acceptable. The likelihood of a number being prime increases significantly with repeated independent runs. By running the

Miller-Rabin test multiple times with different bases, we can reduce the probability of a false positive with a high level of confidence. Additionally, the test guarantees no false negatives, so if a number is not prime, the algorithm will always detect it as a composite.

Q8: Given 2 as a primitive root of 11 construct a table of discrete logarithms.

A handwritten table on lined paper showing powers of 2 modulo 11. The table is organized as follows:

i	$2^i \text{ mod } 11$	a	$\log_{2, 11} a$
1	$(2)^1 \text{ mod } 11 = 2$		
2	$(2)^2 \text{ mod } 11 = 4$		
3	$(2)^3 \text{ mod } 11 = 8$		
4	$(2)^4 \text{ mod } 11 = 5$		
5	$(2)^5 \text{ mod } 11 = 10$		
6	$(2)^6 \text{ mod } 11 = 9$		
7	$(2)^7 \text{ mod } 11 = 7$		
8	$(2)^8 \text{ mod } 11 = 3$		
9	$(2)^9 \text{ mod } 11 = 6$		
10	$(2)^{10} \text{ mod } 11 = 1$
